## **COMMON ENTRANCE EXAMINATION AT 13+**

## **SCIENCE**

## **CHEMISTRY**

Tuesday 25 January 2011

Please read this information before the examination starts.

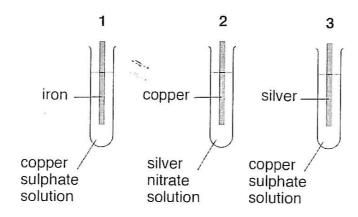

- This examination is 40 minutes long.
- The answers should be written on the question paper.
- Answer all the questions.
- Calculators may be required.

| Und  | derline the option w                                      | hich best completes e                              | ach of the following:                         |                    |     |
|------|---|--|---|--------------------|-----|
| (a)  | The colours in a sa                                       | ample of ink could be                              | separated by                                  |                    |     |
|      | chromatography  | ·n.,   | distillation                                  |                    |     |
|      | filtration  | **   | fractional distilla                           | ation              |     |
| (b)  | Petrol can be sepa  | arated from crude oil b                            | у   |                    |     |
|      | chromatography  |  | distillation                                  |                    |     |
|      | filtration  |  | fractional distilla                           | ation              |     |

2.

3. The following test tubes were set up:

| test tube   | observations  |  |
|---|---|--|
| iron turned pink brown; the blue solution lost its colour |   |  |
| 2   | silvery crystals formed on the copper; the solution became light blue |  |
| 3   |   |  |

| (a) | Complete the word equation for the | e reaction in the first test tube. |
|-----|------------------------------------|------------------------------------|
|     |                                    |                                    |

| iron+ copper sulphate → (2 | iron+ | copper sulp | ohate → | ± |  | (2 | ) |
|----------------------------|-------|-------------|---------|---|--|----|---|
|----------------------------|-------|-------------|---------|---|--|----|---|

(b) Put the three metals in order of reactivity (most reactive first).

| <br>(1 | ) |
|--------|---|
| <br>11 | 1 |

(c) Predict and explain what you would see happen, if anything, in test tube 3.

......(2)

- (d) Pieces of iron, copper and silver were placed in hydrochloric acid. Only one of the metals reacted.
  - (i) Which metal reacted?

..... (1)

(ii) Describe what you would see when this metal reacted with hydrochloric acid.

......(1)

4. Calamine lotion is a suspension of small particles of a solid in a liquid.

(a) Draw a labelled diagram of the apparatus you could use to separate the liquid from the particles of solid.

(3)

(b) One of the solids in calamine lotion is a compound containing zinc.

When dilute hydrochloric acid is added to some of this, it fizzes and produces a gas.

(i) How could you show that this gas is carbon dioxide?

test: .....

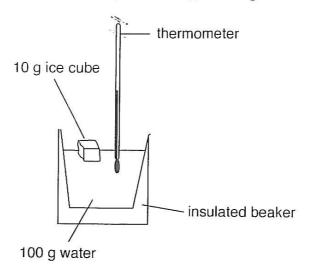

result: ...... (2)

(ii) Name the zinc compound present in calamine.

......(1)

5. An ice cube at 0 °C and weighing 10 g was added to 100 g of water at 20 °C in the apparatus shown below.

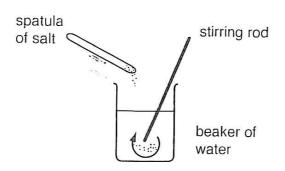

The beaker was well insulated to stop heat being lost or gained from the surroundings.

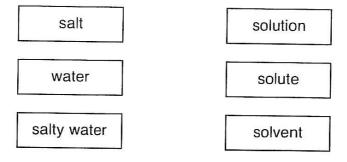

The ice cube floated on top of the water and after a few minutes it had melted.

| (a)      | Describe the arrangement of water r                                    | molecules in                               |         |     |
|----------|--|--|---------|-----|
|          | liquid water:  |  | ••••••  |     |
|          |  |  |         |     |
|          | ice:   |  | •••••   |     |
|          |  |  |         | (2) |
| (b)      | (i) What can you say about the der                                     | nsity of ice compared to liquid water?     |         |     |
|          |  |  |         | (1) |
|          | (ii) Suggest an explanation for your molecules in ice and in liquid wa | answer in terms of the arrangement of ter. | water   |     |
|          |  | ······································     | ******* |     |
|          |  |  | ******* | (1) |
| (c)      | After the ice had melted, suggest val                                  | ues for the following:                     |         |     |
|          | the total mass of water:   | g  | Ţ.      |     |
|          | the temperature of the water:  | °C   |         | (2) |
| S.A. 283 | 112 <b>31</b>  | 5  | Turn o  | ver |

6. Some salt was added to some water and stirred so that it dissolved to make salty water.

(a) Match the following substances with the term which describes them.

(2)

Joe investigated how quickly the salt dissolved in relation to how fast he stirred it. Here are his results:

| amount of stirring, in stirs per minute | time to dissolve, in seconds |
|---|------------------------------|
| 30                                      | 145                          |
| 60                                      | 64                           |
| 120                                     | 31                           |
| 180                                     | 24                           |

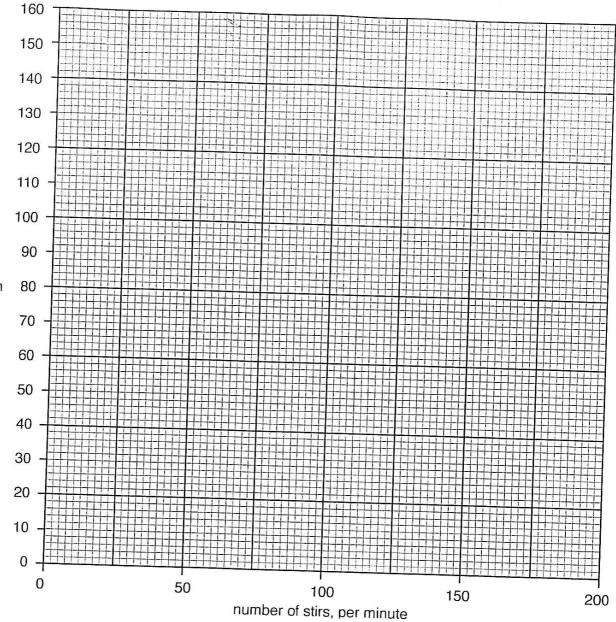

| (b) | State three things which he needed to keep the same in his investigation in order to make it a fair test. | order |  |
|-----|---|-------|--|
|     | 1:  |       |  |
|     | 2:  |       |  |
|     | 3:  | (2)   |  |

(c) (i) Plot his results on the graph below.

(2)

(ii) Draw a line of best fit.

(1)

time for salt to dissolve, in seconds

- (d) Use your graph to predict how long the salt would take to dissolve with 90 stirs per minute.
  - ..... seconds (1)
- (e) Susie said that, as it was hard to be consistent with the stirring, she did not think that his results were very reliable.

Suggest what Joe could do to make his results more reliable.

.....(1)

| (f     | (f) His prediction for his investigation was right.  |                  |
|--------|--|------------------|
|        | What was his prediction?   |                  |
|        |  | (1)              |
| (g     | (g) At the end of his investigation he wanted to get the salt back.<br>Describe how he could do this.  |                  |
|        |  |                  |
|        |  |                  |
|        |  | (2)              |
| 7. (a) | (a) Match the following solutions with their descriptions.   |                  |
|        | solution description   |                  |
|        | limewater neutral  |                  |
|        | distilled water acidic   |                  |
|        | vinegar alkaline   | (2)              |
| (b)    | b) The following volumes of solutions of hydrochloric acid and solution were mixed together and the solution were mixed together and the solution were mixed together. | sodium hydroxide |

ution were mixed together and then tested with Universal Indicator.

| volume of hydrochloric<br>acid, in cm <sup>3</sup> | volume of sodium hydroxide, in cm <sup>3</sup> | Universal Indicator colour |
|--|--|----------------------------|
| 20   | 10   |                            |
| 20   | 20   |                            |
| 20   | 30   |                            |

| (I) Which piece of equipage of liquid used?                         | ment would you use to mea                         | isure accurately the volumes | ;   |
|---|---|------------------------------|-----|
| The three colours I.I.  | ·   |                              | . ( |
|   | d were red, purple and gree                       |                              |     |
| (ii) Fill in the colours in th                                      | ne correct place in the table                     | •                            | (   |
| (iii) Name the type of read   | ction which is taking place.                      |                              |     |
|   |   |                              | (   |
| (iv) Complete the word ec   | uation for the reaction takir                     | ng place:                    |     |
| hydrochloric + sodiu<br>acid hydro                                  |   | +                            | (2  |
| It was noticed that the read  | ction gave out heat.                              |                              |     |
| The temperature rise was  | recorded in each case.                            |                              |     |
| volume of hydrochloric<br>acid, in cm³                              | volume of sodium<br>hydroxide, in cm <sup>3</sup> | temperature<br>rise, in °C   |     |
| 20  | 10  | 5                            |     |
| 20  | 20  | 11                           |     |
| 20  | 30  | 8                            |     |
| (i) Which piece of equipm   | ent would you use to meas                         | ure this?                    |     |
|   |   |                              | /-1 |
|   |   |                              | (1  |
| (ii) Explain why the 20/20  | mixture gave out the most I                       | neat.                        |     |
|   |   |                              |     |
|   |   |                              |     |
|   |   |                              | (2) |
| (iii) Predict the temperature<br>40 cm <sup>3</sup> of sodium hydro | e rise when 40 cm <sup>3</sup> of hyd<br>xide.    | rochloric acid is added to   |     |
|   |   |                              | (1) |
|   |   |                              | ,   |

8. Galena is an ore of a compound of the elements lead and sulphur.

| (a) What do you understand by the word compound?   |       |
|--|-------|
|  |       |
|  | . (2) |
| To extract the lead, first the ore is roasted in air.  |       |
| This makes two products: lead oxide and an acidic gas.   |       |
| (b) Suggest what the acidic gas might be.  |       |
|  | (1)   |
| This gas could cause damage to the environment if released into the atmosphere, so the gas is passed through a substance to remove it. | Û     |
| (c) (i) Describe one way in which the acidic gas could cause damage.   |       |
|  |       |
|  | (1)   |
| (ii) What sort of substance could be used to get rid of the acidic gas?  |       |
|  | (1)   |

| Then the lead oxide is heated in a coke (carbon) furnace to produce the lead. |     |
|---|-----|
| (d) (i) Complete the word equation for the second stage of the extraction:    |     |
| lead oxide + carbon → lead +  | (1) |
| (ii) The lead oxide is said to have been reduced by this process.             |     |
| What do you understand by this?   |     |
|   | (1) |
| (iii) Explain how you could show that the lead formed at the end was a metal. |     |
|   | /11 |

(Total marks: 60)
